Title:
**Assessment of practical fast transient stability methods :
performance comparison.Phase II.**

File Size:764,8 KB **Pages NB:**28 **Study Committee :** 38 (now C4) **WG (TF):** WG 38.02.09 **Year:** 1995

Abstracts

Power systems are increasingly being planned with heavier loading on existing transmission circuits to cope with increasing power transfers without constructing new lines. This has meant that the system is planned and operated closer to the transient stability limits. This Phase II report covers a. Stability limits on power flows; b. Higher-order machine models and c. AVR and governor models.
